Description

I created this class to present the public an easy to use system for protecting pages and register users. Of course there are a lot of more flexible and powerful solutions on the net, but I hope this will help people with limited with PHP classes. They main features are: User-login, user registration, user update, remember login information, page protection, forgotten password recovery, mail based account activation and multi language message reporting. The class is powered by MySQL and PHP sessions. Inside the package are examples for all primary methods.
