Description

HAWHAW is a PHP class library you can use to create hybrid web pages. With HAWHAW you can publish dynamic WML pages and control the output with a normal HTML browser. WML (Wireless Markup Language) is a HTML-like language which is interpreted by WAP enabled mobile phones. The problem is, that neither WAP browsers are capable to display HTML pages, nor HTML browsers are capable to display WML pages. With HAWHAW V2.01 your PHP-enabled APACHE webserver can host hybrid pages, which can be displayed by both HTML and WML browsers simultaneously.
